

# MSc Scientific Computing Dissertation

## ARM Cluster Linpack Benchmarks

John Duffy

August 2020

## 1 Introduction

<https://github.com/johnduffymsc/picluster>

### 1.1 Aims

#### 1.1.1 Investigate Maximum Achievable Linpack Performance

Efficiency... achieved vs theoretical maximum

#### 1.1.2 Investigate Gflops/Watt

Green500 ranking...

#### 1.1.3 Overview of Competitive Available Gflops/£

Buy lots of Pi's, or buy a bigger machine...

Plot Gflops vs £...

### 1.2 Typography

This is a computer name...

node1

This is a command to type...

```
$ grep
```

This is a command output displayed on your screen...

Listing 1: cat /proc/softirqs

|    |            | CPU0    | CPU1    | CPU2    | CPU3    |
|----|------------|---------|---------|---------|---------|
| 1  | HI :       | 1       | 0       | 0       |         |
|    | TIMER :    | 3835342 | 3454143 | 3431155 | 3431023 |
|    | NET_TX :   | 36635   | 0       | 0       |         |
| 0  |            |         |         |         |         |
|    | NET_RX :   | 509189  | 146     | 105     | 121     |
|    | BLOCK :    | 95326   | 4367    | 4311    | 4256    |
|    | IRQ_POLL : | 0       | 0       | 0       |         |
| 0  |            |         |         |         |         |

## 2 Raspberry Pi 4 Model B

### 2.1 Description

Photo...

Description...

Highlights...

Limitations...

Reference data sheet in Appendix...

### 2.2 Theoretical Maximum Performance (Gflop/s)

The Raspberry Pi 4 Model B uses the Broadcom BCM2711 System on a Chip (Soc).

Block diagram from Cortex-A72 Software Optimisation Guide

4 cores

1.5 GHz

128 bit SIMD

4 GB memory (our chosen model)

Caches...

Pipeline...

Simplistically, ...

This ignores instructions pipelining benefits...

## 3 Pi Cluster

Photo...

Description...

Ubuntu 20.04 LTS 64-bit Preinstalled Server...

Reference Appendix A for detailed build instructions...

Limitations...

Software/update management...

Next PXE/NFS boot...

Cluster management tools

BLAS libraries...

BLAS library management... `update-alternatives --config libblas.so.3-aarch64-linux-gnu`

`picluster/tools...` `appendix ?...` use from `node1...`

## 4 High-Performance Linpack (HPL) Benchmark

Reference Paper...

[https://www.netlib.org/benchmark/hpl/...](https://www.netlib.org/benchmark/hpl/)

Describe algorithm...

Terminology  $R_{peak}$ ,  $R_{max}$ ..., problem size...

Describe methodology for determining main parameters NB, N, P and Q...

N formula...

Reference <http://hpl-calculator.sourceforge.net>

### 4.1 Building and Installing HPL

See Appendix...

## 4.2 HPL.dat

Describe HPL.dat parameters...

Listing 3: Example HPL.dat

```
1 HPLinpack benchmark input file
2 Innovative Computing Laboratory, University of Tennessee
3 HPL.out      output file name (if any)
4 0            device out (6=stdout,7=stderr,file)
5 1            # of problems sizes (N)
6 26208        Ns
7 1            # of NBs
8 32           NBs
9 0            PMAP process mapping (0=Row-,1=Column-major)
10 2           # of process grids (P x Q)
11 1 2         Ps
12 8 4         Qs
13 16.0        threshold
14 3           # of panel fact
15 0 1 2       PFACTs (0=left, 1=Crout, 2=Right)
16 2           # of recursive stopping criterium
17 2 4         NBMINs (>= 1)
18 1           # of panels in recursion
19 2           NDIVs
20 3           # of recursive panel fact.
21 0 1 2       RFACTs (0=left, 1=Crout, 2=Right)
22 1           # of broadcast
23 0           BCASTs (0=1rg,1=1rM,2=2rg,3=2rM,4=Lng,5=LnM)
24 1           # of lookahead depth
25 0           DEPTHs (>=0)
26 2           SWAP (0=bin-exch,1=long,2=mix)
27 64          swapping threshold
28 0           L1 in (0=transposed,1=no-transposed) form
29 0           U in (0=transposed,1=no-transposed) form
30 1           Equilibration (0=no,1=yes)
31 8           memory alignment in double (> 0)
```

A detailed description of each line of this file is ...

## 4.3 HPL.out

Describe HPL.out...

It is very easy to use `grep` to find the lines in HPL.out containing the results.

And to then conduct a general numeric sort, first by P and then by Gflops, to find Rmax for each P and Q pair, squeezing repeated white space down to a single space for readability.

```
$ grep WR HPL.out | sort -g -k 4 -k 7 | tr -s ' ' > HPL.out.sorted
```

Listing 4: Example HPL.out.sorted

```
1 WR00C2R2 26208 32 1 8 802.01 1.4965e+01
2 WR00R2C2 26208 32 1 8 799.75 1.5007e+01
3 WR00L2L2 26208 32 1 8 796.04 1.5077e+01
4 WR00C2C2 26208 32 1 8 794.65 1.5103e+01
5 WR00L2C2 26208 32 1 8 793.86 1.5118e+01
6 WR00C2L2 26208 32 1 8 793.67 1.5122e+01
7 WR00R2L2 26208 32 1 8 793.48 1.5126e+01
8 WR00R2R2 26208 32 1 8 790.26 1.5187e+01
9 WR00L2R2 26208 32 1 8 789.16 1.5208e+01
10 WR00R2L4 26208 32 1 8 774.49 1.5497e+01
11 WR00C2R4 26208 32 1 8 773.52 1.5516e+01
12 WR00L2L4 26208 32 1 8 770.20 1.5583e+01
13 WR00R2C4 26208 32 1 8 767.92 1.5629e+01
14 WR00L2C4 26208 32 1 8 763.10 1.5728e+01
15 WR00L2R4 26208 32 1 8 762.43 1.5742e+01

18 WR00C2L4 26208 32 1 8 757.87 1.5836e+01
19 WR00R2R2 26208 32 2 4 728.78 1.6468e+01
20 WR00R2C2 26208 32 2 4 728.21 1.6481e+01
21 WR00R2L2 26208 32 2 4 726.55 1.6519e+01
22 WR00C2R2 26208 32 2 4 722.38 1.6614e+01
23 WR00L2C2 26208 32 2 4 721.63 1.6632e+01
24 WR00L2L2 26208 32 2 4 721.54 1.6634e+01
25 WR00C2C2 26208 32 2 4 721.25 1.6640e+01
26 WR00C2L2 26208 32 2 4 720.82 1.6650e+01
27 WR00L2R2 26208 32 2 4 720.80 1.6651e+01
28 WR00L2R4 26208 32 2 4 692.09 1.7341e+01
29 WR00R2C4 26208 32 2 4 690.37 1.7385e+01
30 WR00C2L4 26208 32 2 4 686.69 1.7478e+01
31 WR00C2C4 26208 32 2 4 686.23 1.7489e+01
32 WR00C2R4 26208 32 2 4 686.08 1.7493e+01
33 WR00L2L4 26208 32 2 4 686.02 1.7495e+01
34 WR00L2C4 26208 32 2 4 685.88 1.7498e+01
35 WR00R2L4 26208 32 2 4 685.76 1.7502e+01
36 WR00R2R4 26208 32 2 4 684.45 1.7535e+01
```

## 4.4 Running xhpl

To run xhpl using the serial version of OpenBLAS...

```
$ ~/picluster/tools/picluster-set-libblas-openblas-serial
```

or, with the serial version of BLIS...

```
$ ~/picluster/tools/picluster-set-libblas-blis-serial
```

```
cd ~/picluster/hpl/hpl-2.3/bin/serial  
mpirun -np 4 xhpl
```

## 5 OpenMPI

What is OpenMPI...

## 6 OpenMPI Baseline Benchmarks

Ubuntu 20.04 LTS 64-bit packages, without any tweaks...

1 core... a single ARM Cortex-A72 core...

1 node... a single Raspberry Pi 4 Model B, 4 x ARM Cortex-A72 cores...

Linpack performance scales with problem size... [REFERENCE](#)

80% of memory a good initial guess... [FAQ](#) [REFERENCE](#)...

Methodology...

1 core... to investigate single core performance... caveats... use 1GB of memory...

1 node... to investigate inter-core performance...

2 nodes... to investigate inter-core and inter-node performance...

1..8 nodes ... to investigate over scaling of performance with node count... with optimal N, NB, P and Q parameters determined from 2 node investigation... caveats...

## 6.1 OpenBLAS

## 6.2 BLIS

## 6.3 1 Core Baseline

Problem size restricted to 80% of memory...

NB 32 to 256 in increments of 8...

| NB | N     | NB  | N     | NB  | N     | NB  | N     | NB  | N     |
|----|-------|-----|-------|-----|-------|-----|-------|-----|-------|
| 32 | 18528 | 80  | 18480 | 128 | 18432 | 176 | 18480 | 224 | 18368 |
| 40 | 18520 | 88  | 18480 | 136 | 18496 | 184 | 18400 | 232 | 18328 |
| 48 | 18528 | 96  | 18528 | 144 | 18432 | 192 | 18432 | 240 | 18480 |
| 56 | 18536 | 104 | 18512 | 152 | 18392 | 200 | 18400 | 248 | 18352 |
| 64 | 18496 | 112 | 18480 | 160 | 18400 | 208 | 18512 | 256 | 18432 |
| 72 | 18504 | 120 | 18480 | 168 | 18480 | 216 | 18360 | -   | -     |

1x1

```
$ mpirun -np 1 xhpl
```

mpirun does bind to core by default for  $np \leq 2$

4 x 4.7527e+00 = 19 Gflops

Explain...

Cache misses from peak...

A single core is capable of achieving maximum theoretical performance... CAVEATS  
whole L2 cache, whole node 4 GB memory, although problem size limited to  
80% of 1 GB...

## 6.4 1 Node Baseline

1x4

Figure 1:  $R_{max}$  vs NB 1 Core using 80% memory.

Figure 2:  $R_{max}$  vs NB 1 Node (4 cores) using 80% memory.

| NB | N     | NB  | N     | NB  | N     | NB  | N     | NB  | N     |
|----|-------|-----|-------|-----|-------|-----|-------|-----|-------|
| 32 | 18528 | 80  | 18480 | 128 | 18432 | 176 | 18480 | 224 | 18368 |
| 40 | 18520 | 88  | 18480 | 136 | 18496 | 184 | 18400 | 232 | 18328 |
| 48 | 18528 | 96  | 18528 | 144 | 18432 | 192 | 18432 | 240 | 18480 |
| 56 | 18536 | 104 | 18512 | 152 | 18392 | 200 | 18400 | 248 | 18352 |
| 64 | 18496 | 112 | 18480 | 160 | 18400 | 208 | 18512 | 256 | 18432 |
| 72 | 18504 | 120 | 18480 | 168 | 18480 | 216 | 18360 | -   | -     |

```
$ mpirun -np 4 xhpl
```

mpirun does bind to socket by default for  $np \geq 2$

## 6.5 2 Node Baseline

Suggests... improve network efficiency?

## 7 Optimisations

### 7.1 Single Core Optimisation

#### 7.1.1 Rebuild libopenblas0-serial

Better BLAS library...

The Debian Science Wiki suggests...

So, following the instructions in /usr/local/share/

Details are in Appendix ?...

Poking around in the OpenBLAS source code, I noticed...

cpuid\_arm64.c

in function void get\_cpuconfig(void)

Listing 5: cpuid\_arm64.c

```
...
case CPU_CORTEXA57:
case CPU_CORTEXA72:
case CPU_CORTEXA73:
    // Common minimum settings for these Arm cores
    // Can change a lot, but we need to be conservative
    // TODO: detect info from /sys if possible
    printf("#define %s\n", cpuname[d]);
    printf("#define L1_CODE_SIZE 49152\n");
    printf("#define L1_CODE_LINESIZE 64\n");
    printf("#define L1_CODE_ASSOCIATIVE 3\n");
    printf("#define L1_DATA_SIZE 32768\n");
    printf("#define L1_DATA_LINESIZE 64\n");
    printf("#define L1_DATA_ASSOCIATIVE 2\n");
    printf("#define L2_SIZE 524288\n");
    printf("#define L2_LINESIZE 64\n");
    printf("#define L2_ASSOCIATIVE 16\n");
    printf("#define DTB_DEFAULT_ENTRIES 64\n");
    printf("#define DTB_SIZE 4096\n");
    break;
...
```

REFERENCE: Arm...

The following two lines are incorrect for the Arm Cortex-A72:

```
printf("#define L2_SIZE 524288\n");  
printf("#define DTB_DEFAULT_ENTRIES 64\n");
```

To reflect the 1MB of L2 cache of the BCM?????, and the 32 entry L1 Data TLB, they should be:

```
printf("#define L2_SIZE 1048576\n");  
printf("#define DTB_DEFAULT_ENTRIES 32\n");
```

Having changed these to the correct values, the build process now accurately reflects the 1MB of L2 cache on line 18 of 0-serial/config.h from which the libopenblas0-serial package is built:

Listing 6: 0-serial/config.h

```
1 #define OS_LINUX 1  
2 #define ARCH_ARM64 1  
3 #define C_GCC 1  
4 #define __64BIT__ 1  
5 #define PTHREAD_CREATE_FUNC pthread_create  
6 #define BUNDERSCORE _  
7 #define NEEDBUNDERSCORE 1  
8 #define ARMV8  
9 #define HAVE_NEON  
10 #define HAVE_VFPV4  
11 #define CORTEXA72  
12 #define L1_CODE_SIZE 49152  
13 #define L1_CODE_LINESIZE 64  
14 #define L1_CODE_ASSOCIATIVE 3  
15 #define L1_DATA_SIZE 32768  
16 #define L1_DATA_LINESIZE 64  
17 #define L1_DATA_ASSOCIATIVE 2  
18 #define L2_SIZE 1048576  
19 #define L2_LINESIZE 64  
20 #define L2_ASSOCIATIVE 16  
21 #define DTB_DEFAULT_ENTRIES 64  
22 #define DTB_SIZE 4096  
23 #define NUM_CORES 4  
24 #define CHAR_CORENAME "CORTEXA72"  
25 #define GEMM_MULTITHREAD_THRESHOLD 4
```

On completion of the build process, and after uninstalling the original libopenblas0-serial package and installing the new one...

Discussion...

### 7.1.2 Rebuild libblis3-serial

## 7.2 Single Node Optimisation

### 7.2.1 Kernel Preemption Model

The Linux kernel has 3 Preemption Models...

1... 2... The default 3...

As per the Help in the Kernel Configuration...

Listing 7: Kernel Configuration Preemption Model Help

```
CONFIG_PREEMPT_NONE:
```

```
This is the traditional Linux preemption model, geared towards
throughput. It will still provide good latencies most of the
time, but there are no guarantees and occasional longer delays
are possible.
```

```
Select this option if you are building a kernel for a server or
scientific/computation system, or if you want to maximize the
raw processing power of the kernel, irrespective of scheduling
latencies.
```

So, kernel rebuilt with CONFIG.PREEMPT\_NONE=y

See Appendix ? on how to rebuild the kernel...

Installed on each node...

So, although this optimisation applies to single node, the benefits of applying this optimisation may not be apparent until the kernel has to juggle networking etc...

RESULTS...

### 7.2.2 Recieve Queues

```
$ sudo perf record mpirun -allow-run-as-root -np 4 xhpl
```

Running xhpl on 8 nodes using OpenBLAS...

```
$ mpirun -host node1:4 ... node8:4 -np 32 xhpl
```

SHORTLY AFTER PROGRAM START...

On node1,... where we initiated...

top...

|                                | NET_TX:   | 222717797  | 228381   | 147690   | 144396   |
|                                | NET_RX:   | 1505715680 | 1132     | 1294     | 1048     |
|                                | BLOCK:    | 63160      | 11906    | 13148    | 11223    |
|                                | IRQ_POLL: | 0          | 0        | 0        |          |
| 0                              | TASKLET:  | 58902273   | 33       | 2        |          |
| 6                              | SCHED:    | 3239933    | 3988327  | 2243001  | 2084571  |
|                                | HRTIMER:  | 8116       | 55       | 53       |          |
| 50                             | RCU:      | 6277982    | 4069531  | 4080009  | 3994395  |

As can be seen...

1. the majority of software interrupts are being generated by network receive (NET\_RX) activity, followed by network transmit activity (NET\_TX)...

2. these interrupts are being almost exclusively handled by CPU0...

What is there to be done?...

1. Reduce the numbers of interrupts...

1.1 Each packet produces an interrupt - interrupt coalescing...

1.2 Reduce the number of packets - increase MTU...

2.1 Share the interrupt servicing activity evenly across the CPUs...

### 7.3 Cluster Optimisation

On node2 start the Iperf server...

```
$ iperf -s
```

On node1 start the Iperf client...

```
$ iperf -c
```

ping tests of MTU...

iperf network speed...

#### 7.3.1 Jumbo Frames

Requires a network switch capable of Jumbo frames...

### 7.4 Kernel TCP Parameters Tuning

sudo shutdown -r now
```

## Appendix A - Pi Cluster Build Instructions

### 7.5 Introduction

This appendix is intended to be a complete and self contained guide for building a Raspberry Pi Cluster. With the caveat that the cluster has the bare minimum software/functionality necessary to compile and run the High Performance Linpack (HPL) benchmark, namely the build-essential package, two BLAS libraries (OpenBLAS and BLIS), and Open-MPI. A number of performance measurement tools are also installed, such as perf and iperf. The latest version of HPL is downloaded and built from source.

It would be a relatively simple task to add... SLIRM or...

The cluster consists of the following components...

8 x Raspberry Pi 4 Model B 4GB compute nodes, node1 to node8  
1 x software development and build node, node9  
9 x Official Raspberry Pi 4 Model B power supplies  
9 x 32GB Class 10 MicroSD cards  
1 x *workstation*, in my case my MacBook Pro,  
macbook  
1 x 8 port Gigabit Router/Firewall  
1 x 16 port Gigabit switch with Jumbo Frame support

Items

Photo

### 7.6 Preliminary Tasks

1. Update the EE-PROM
2. Get MAC address
3. Generate keys
4. Amend macbook /etc/hosts file...

### 7.6.1 Update Raspberry Pi EE-PROMs

### 7.6.2 Get Raspberry Pi MAC Addresses

### 7.6.3 Generate User Key Pair

On macbook (no passphrase):

```
$ ssh-genkey -t rsa -C john
```

This will create two files... in ...

### 7.6.4 Amend macbook /etc/hosts

On macbook, using your favourite editor, add the following to /etc/hosts:

```
192.168.0.1 node1
192.168.0.2 node2
192.168.0.3 node3
192.168.0.4 node4
192.168.0.5 node5
192.168.0.6 node6
192.168.0.7 node7
192.168.0.8 node8
192.168.0.9 node9
```

This enables...

```
ssh john@node1
```

or, the abbreviated...

```
ssh node1
```

provided the user name on the macbook is the same as the Linux user created by cloud-init.

### 7.6.5 Router/Firewall Configuration

Local network behind firewall/switch: 192.168.0.254

WAN address LAN address

Firewall/Switch (Netgear FVS318G)

Describe DHCP reservations mapping IP to MAC addresses.

Describe ssh access

Add relevant PDFs.

### 7.6.6 Create the Raspberry Pi Ubuntu Server Image

On macbook...

Download Ubuntu 20.04 LTS 64-bit pre-installed server image for the Raspberry Pi 4...

Double click to uncompress the .xz file which leaves the .img file.

Double click to mount the .img in the filesystem...

Amend /Volumes/system-boot/user-data...

```
#cloud-config

# This is the user-data configuration file for cloud-init. By default this s
# up an initial user called "ubuntu" with password "ubuntu", which must be
# changed at first login. However, many additional actions can be initiated
# first boot from this file. The cloud-init documentation has more details:
#
# https://cloudinit.readthedocs.io/
#
# Some additional examples are provided in comments below the default
# configuration.

# On first boot, set the (default) ubuntu user's password to "ubuntu" and
# expire user passwords
chpasswd:
  expire: false
  list:
    - ubuntu:ubuntu
    - john:john

# Enable password authentication with the SSH daemon
ssh_pwauth: true

## On first boot, use ssh-import-id to give the specific users SSH access to
## the default user
```

```

#ssh_import_id:
#- lp:my_launchpad_username
#- gh:my_github_username

## Add users and groups to the system, and import keys with the ssh-import-id
## utility
#groups:
#- robot: [robot]
#- robotics: [robot]
#- pi
#
groups:
- john: [john]

#users:
#- default
#- name: robot
# gecos: Mr. Robot
# primary_group: robot
# groups: users
# ssh_import_id: foobar
# lock_passwd: false
# passwd: $5$hkui88$nvZgIle31cNpryjRf09uArF7DYiBcWEnjq7L1AQNN3
users:
- default
- name: john
  gecos: John Duffy
  primary_group: john
  sudo: ALL=(ALL) NOPASSWD:ALL
  shell: /bin/bash
  ssh_authorized_keys:
    - ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQgQDGsnzP+1Q6NgeeKFTd/+Mom+UCYJTL/wzI

## Update apt database and upgrade packages on first boot
#package_update: true
#package_upgrade: true
package_update: true
package_upgrade: true

## Install additional packages on first boot
#packages:
#- pwgen
#- pastebinit
#- [libpython2.7, 2.7.3-0ubuntu3.1]
packages:
- git

```

```

- tree
- unzip
- iperf
- net-tools
- linux-tools-common
- linux-tools-raspi
- build-essential
- gdb
- openmpi-common
- openmpi-bin
- libblis3-serial
- libblis3-openmp
- libopenblas0-serial
- libopenblas0-openmp

## Write arbitrary files to the file-system (including binaries!)
#write_files:
#- path: /etc/default/keyboard
#   content: |
#       # KEYBOARD configuration file
#       # Consult the keyboard(5) manual page.
#       XKBMODEL="pc105"
#       XKBLAYOUT="gb"
#       XKBVARIANT=""
#       XKBOPTIONS="ctrl: nocaps"
#   permissions: '0644'
#   owner: root:root
#- encoding: gzip
#   path: /usr/bin/hello
#   content: !!binary |
#       H4sIAIDb/U8C/1NW1E/KzNMvzuBKTc7IV8hIzcnJVyJPL8pJ4QIA6N+MVxsAAAA=
#   owner: root:root
#   permissions: '0755'
write_files:
- path: /etc/hosts
  content: |
    127.0.0.1 localhost
    192.168.0.1 node1
    192.168.0.2 node2
    192.168.0.3 node3
    192.168.0.4 node4
    192.168.0.5 node5
    192.168.0.6 node6
    192.168.0.7 node7
    192.168.0.8 node8
    192.168.0.9 node9

```

Figure 5: Using Raspberry Pi Imager to erase and format a MicroSD card.

```
permissions: '0644'
owner: root:root

## Run arbitrary commands at rc.local like time
#runcmd:
#- [ ls, -l, / ]
#- [ sh, -xc, "echo $(date) ': hello world!'" ]
#- [ wget, "http://ubuntu.com", -O, /run/mydir/index.html ]
runcmd:
- hostnamectl set-hostname --static node$(hostname -i | cut -d ' ' -f 1 | cu
- reboot
```

Eject/unmount .img file

Use Raspberry Pi Imager to erase...

Then use the Raspberry Pi Imager to write preinstalled server image to the MicroSD card...

When complete, remove the MicroSD card from the card reader, place it the Raspberry Pi and plug in the power cable.

The cloud-init configuration process will now start. The Raspberry Pi will ac-

Figure 6: Using Raspberry Pi Imager to write the server image to a MicroSD card.

quire its IP address from the router, setup users, update apt, upgrade the system, download software packages, set the hostname (based on the IP address), and finally the system will reboot.

## 7.7 Post-Installation Tasks

### 7.7.1 Enable No Password Access

This is required for Open-MPI...

Our public key was installed on each node by cloud-init. So, we can ssh into each node without a password, and use the abbreviated ssh node1, instead of ssh john@node1 (assuming john is the user name on the workstation).

We need to copy our private key to node1 (only node1)...

```
scp ~/.ssh/id_rsa node1:~/.ssh
```

Then to enable access to nodes node2 to node9 without a password from node1, we need to import the ... keys into the node1 knownhosts file...

This is easily done...

From macbook, ssh into node1...

```
ssh node1
```

and then from node1, for each of the nodes node2 to node9:

```
ssh node2
```

This will generate...

```
The authenticity of host 'node2 (192.168.0.2)' can't be established.  
ECDSA key fingerprint is SHA256:5VgsnN2nPvpfbJmALh3aJd0eT/NvDXqN8TCreQyNaFA.  
Are you sure you want to continue connecting (yes/no/[fingerprint])?
```

responding yes, imports the key into the node1 knownhosts file...

```
exit
```

Next node...

This is only required to be done on initial contact with nodes node2 to node9 (unless the keys on these nodes change)

## 7.7.2 Uninstall unattended-upgrades

The `unattended-upgrades` package is installed automatically...

This can potentially interfere with long running benchmarks...

Remove...

From macbook:

```
$ ssh node1  
$ ~/picluster/tools/do "sudo apt remove unattended-upgrades"
```

Don't forget to upgrade your cluster regularly at convenient times with...

```
$ ssh node1  
$ ~/picluster/tools/upgrade
```

### 7.7.3 Add Source Repositories

We are going to be rebuilding some packages from source...

```
$ ssh node1
$ sudo touch /etc/apt/sources.list.d/picluster.list
$ sudo vim /etc/apt/sources.list.d/picluster.list
```

... and add the following source repositories...

Listing 9: /etc/apt/sources.list.d/picluster.list

```
1 deb-src http://archive.ubuntu.com/ubuntu focal main universe
2 deb-src http://archive.ubuntu.com/ubuntu focal-updates main universe
```

... and then update the repository cache...

```
$ sudo apt update
```

### 7.7.4 Create a Project Repository

Xpand upon...

```
$ ssh node1
$ mkdir picluster
$ cd picluster
$ git init
```

Ensure you do push your repository to a remote repository at regular intervals...

### 7.7.5 Select BLAS Library

We have installed four BLAS libraries...

Confirm all nodes are using the same one initially...

```
ssh node1 sudo update-alternatives --config libblas.so.3-aarch64-linux-gnu
```

TODO screen output...

Confirm option 0, OpenBLAS, is selected. Press return to keep this option and then exit.

## Appendix ? - General Kernel Build Procedure

This procedure is derived from the Ubuntu Wiki BuildYourOwnKernel document...

Make sure you have made the source code repositories available as per...

Create a kernel build directory with the correct directory permissions to prevent source download warnings.

```
$ ssh node1
$ mkdir -p ~/picluster/build/kernel
$ sudo chown _apt:root ~/picluster/build/kernel
$ cd ~/picluster/build/kernel
```

Install the kernel build dependencies...

```
$ sudo apt-get build-dep linux linux-image-$(uname -r)
```

Download the kernel source...

```
$ sudo apt-get source linux-image-$(uname -r)
$ cd linux-raspi-5.4.0
```

This bit is a fix for the subsequent `editconfigs` step of the build procedure...

```
$ cd debian.raspi/etc
$ sudo cp kernelconfig kernelconfig.original
$ sudo vim kernelconfig
```

And make the following change...

Listing 10: `diff kernelconfig kernelconfig.original`

```
5c5
< archs="arm64 "
---
> archs="armhf arm64 "
```

Then move back up to the kernel source top level directory...

```
$ cd ../..
```

Prepare the build scripts...

```
$ sudo chmod a+x debian/rules
$ sudo chmod a+x debian/scripts/*
$ sudo chmod a+x debian/scripts/misc/*
```

SOURCE CHANGES AND/OR `verb—editconfigs—` AT THIS POINT

```
$ sudo apt install libncurses-dev
$ sudo LANG=C fakeroot debian/rules clean
$ sudo LANG=C fakeroot debian/rules editconfigs
```

Tweak the kernel name for identification...

```
$ cd debian.raspi
$ sudo cp changelog changelog.original
$ sudo vim changelog
```

And make the following change, where `+piccluster0` is our kernel identifier...

Listing 11: `diff changelog changelog.original`

```
1c1
< linux-raspi (5.4.0-1015.15+piccluster0) focal; urgency=medium
---
> linux-raspi (5.4.0-1015.15) focal; urgency=medium
```

Move up to the top level kernel source directory...

```
$ cd ..
```

And build the kernel...

```
$ sudo LANG=C fakeroot debian/rules clean
$ sudo LANG=C fakeroot debian/rules binary-arch
cd ..
```

Install the new kernel...

```
$ sudo dpkg -i linux*piccluster0*.deb
$ sudo shutdown -r now
```

Another build procedure fix...

After each kernel build delete the `linux-libc-dev` directory...

```
$ cd ~/picluster/build/kernel/linux-raspi-5.4.0/debian  
$ rm -rf linux-libc-dev  
$ cd ..
```

## Appendix ? - Kernel Build with Jumbo Frames

Standard MTU is 1500 bytes...

Maximum payload size is 1472 bytes...

NB of 184 (x 8 bytes for Double Precision) = 1472 bytes...

NB > 184 => packet fragmentation => reduced network efficiency...

This causes drop of in performance???...

Max MTU on Raspberry Pi 4 Model B is set at build time to 1500...

Not configurable above 1500...

TODO: EXAMPLE OF ERROR MSG...

Need to build the kernel with higher MTU...

Make the required changes to the source... as per REFERENCE

```
cd linux-raspi-5.4.0

sudo vim include/linux/if_vlan.h...
#define VLAN_ETH_DATA_LEN    9000
#define VLAN_ETH_FRAME_LEN   9018

sudo vim include/uapi/linux/if_ether.h...
#define ETH_DATA_LEN          9000
#define ETH_FRAME_LEN         9014

sudo vim drivers/net/ethernet/broadcom/genet/bcmgenet.c...
#define RX_BUF_LENGTH         10240
```

Add a Jumbo Frames identifier, "+jff", to the new kernel name...

```
sudo vim debian.raspi/changelog...
linux (5.4.0-1013.13+jff) focal; urgency=medium
```

## Appendix B - High-Performance Linpack (HPL) Installation

Download and install the latest version of HPL on node1...

```
ssh node1
cd picluster
mkdir hpl
cd hpl
wget https://www.netlib.org/benchmark/hpl/hpl-2.3.tar.gz
gunzip hpl-2.3.tar.gz
tar xvf hpl-2.3.tar
rm hpl-2.3.tar
cd hpl-2.3
```

Create Make.serial file...

```
cd setup
bash make_generic
cd ..
cp setup/Make.UNKNOWN Make.serial
```

Amend Make.serial as per...

Build...

```
make arch=serial
```

This creates xhpl and HPL.dat in bin/serial

Copy xhpl to all nodes (only xhpl, and not HPL.dat)...

```
ssh node2 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node3 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node4 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node5 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node6 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node7 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node8 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node9 mkdir -p picluster/hpl/hpl-2.3/bin/serial

scp bin/serial/xhpl node2:~picluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node3:~picluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node4:~picluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node5:~picluster/hpl/hpl-2.3/bin/serial
```

```
scp bin/serial/xhpl node6:~piccluster/hpl/hpl-2.3/bin/serial  
scp bin/serial/xhpl node7:~piccluster/hpl/hpl-2.3/bin/serial  
scp bin/serial/xhpl node8:~piccluster/hpl/hpl-2.3/bin/serial  
scp bin/serial/xhpl node9:~piccluster/hpl/hpl-2.3/bin/serial
```

## Appendix ? - High Performance Linpack (HPL) Installation

Download and install the latest version of HPL on node1...

```
ssh node1
cd picluster
mkdir hpl
cd hpl
wget https://www.netlib.org/benchmark/hpl/hpl-2.3.tar.gz
gunzip hpl-2.3.tar.gz
tar xvf hpl-2.3.tar
rm hpl-2.3.tar
cd hpl-2.3
```

Create Make.serial file...

```
cd setup
bash make_generic
cd ..
cp setup/Make.UNKNOWN Make.serial
```

Amend Make.serial as per...

Build...

```
make arch=serial
```

This creates xhpl and HPL.dat in bin/serial

Copy xhpl to all nodes (only xhpl, and not HPL.dat)...

```
ssh node2 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node3 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node4 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node5 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node6 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node7 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node8 mkdir -p picluster/hpl/hpl-2.3/bin/serial
ssh node9 mkdir -p picluster/hpl/hpl-2.3/bin/serial

scp bin/serial/xhpl node2:~picluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node3:~picluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node4:~picluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node5:~picluster/hpl/hpl-2.3/bin/serial
```

```
scp bin/serial/xhpl node6:~piccluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node7:~piccluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node8:~piccluster/hpl/hpl-2.3/bin/serial
scp bin/serial/xhpl node9:~piccluster/hpl/hpl-2.3/bin/serial
```

## Appendix ? - Rebuild OpenBLAS

```
$ ssh node1
$ mkdir -p build/openblas
$ chown -R _apt:root build
$ cd build/openblas
$ sudo apt-get source openblas
$ sudo apt-get build-dep openblas
$ cd openblas-0.3.8+ds
```

Edit cpuid\_arm64.c...

```
$ sudo cp cpuid_arm64.c cpuid_arm64.c.original
$ sudo vim cpuid_arm64.c
```

```
$ diff cpuid_arm64.c cpuid_arm64.c.original
```

```
275c275
<         printf("#define L2_SIZE 1048576\n");
---
>         printf("#define L2_SIZE 524288\n");
278c278
<         printf("#define DTB_DEFAULT_ENTRIES 32\n");
---
>         printf("#define DTB_DEFAULT_ENTRIES 64\n");
```

And, then following the instructions in debian/README.Debian

```
$ DEB_BUILD_OPTIONS=custom dpkg-buildpackage -uc -b
```

Once the build is complete..

```
cd ..
$ sudo apt remove libopenblas0-serial
$ sudo dpkg -i libopenblas0-serial\_0.3.8+ds-1\_arm64.deb
```

Ensure the correct BLAS library is being used...

```
$ sudo update-alternatives --config libblas.so.3-aarch64-linux-gnu
```

copy to other nodes remove old... install new...

If more than one BLAS library is installed, check update-alternatives!!!

ssh node2 .. node8

```
$ ssh node2 sudo apt remove libblas0-serial
$ scp libopenblas0-serial\_0.3.8+ds-1\_arm64.deb node2:~
$ ssh sudo dpkg -i libopenblas0-serial\_0.3.8+ds-1\_arm64.deb
$ ssh sudo update-alternatives --config libblas.so.3-aarch64-linux-gnu
```

## Appendix ? - Rebuild libblis3-serial

```
ssh node1
mkdir -p picluster/build/blis
cd picluster/build/blis
apt-get source blis
sudo apt-get build-dep blis
cd blis-0.6.1
```

## Appendix ? - Hints

Hints from experience... and time savers... for building a development cluster on a local network.

### 7.8 IP/MAC Addresses

If IP/MAC address assignments get confused, which is easily done during initial build, view IP address assignments on the local network with:

```
arp -a
```

Then delete *incomplete* IP addresses with:

```
sudo arp -d incomplete-ip-address
```

### 7.9 SSH known\_hosts

If *ssh* reports differing keys in 'known-hosts', and warns of a potential 'man-in-the-middle-attack', then just delete 'known-hosts':

```
sudo rm ~/.ssh/known_hosts
```

'known\_hosts' will be re-populated as you log into each node.

### 7.10 tmux

**tmux** is your friend!

Monitoring long running jobs from a workstation, which goes to sleep after a period of no activity, for example, may interfere with the running of the jobs if a SSH connection is broken.

Use a **tmux** session to start long running jobs, and then detach from the **tmux** session. The job will quite happily run in the background on the cluster. Turn the workstation off and go to bed. In the morning, turn the workstation on and 'attach' to the **tmux** session. All will be well.

## 7.11 git

`git` is your best friend!

During your cluster build you will accidentally delete files, results etc. After every significant...

## Appendix ? - cloud-init user-data

Listing 12: picluster/cloud-init/user-data

```
1  #cloud-config
2
3  # This is the user-data configuration file for cloud-init. By default this s
4  # up an initial user called "ubuntu" with password "ubuntu", which must be
5  # changed at first login. However, many additional actions can be initiated
6  # first boot from this file. The cloud-init documentation has more details:
7  #
8  # https://cloudinit.readthedocs.io/
9  #
10 # Some additional examples are provided in comments below the default
11 # configuration.
12
13 # On first boot, set the (default) ubuntu user's password to "ubuntu" and
14 # expire user passwords
15 chpasswd:
16     expire: false
17     list:
18     - ubuntu:ubuntu
19     - john:john
20
21 # Enable password authentication with the SSH daemon
22 ssh_pwauth: true
23
24 ## On first boot, use ssh-import-id to give the specific users SSH access to
25 ## the default user
26 #ssh_import_id:
27 #- lp:my_launchpad_username
28 #- gh:my_github_username
29
30 ## Add users and groups to the system, and import keys with the ssh-import-i
31 ## utility
32 #groups:
33 #- robot: [robot]
34 #- robotics: [robot]
35 #- pi
36 #
37 groups:
38 - john: [john]
39
40 #users:
41 #- default
42 #- name: robot
```

```

43 # gecos: Mr. Robot
44 # primary_group: robot
45 # groups: users
46 # ssh_import_id: foobar
47 # lock_passwd: false
48 # passwd: $5$hkui88$nvZgIle31cNpryjRf09uArF7DYiBcWEnjqg7L1AQNN3
49 users:
50 - default
51 - name: john
52   gecos: John Duffy
53   primary_group: john
54   sudo: ALL=(ALL) NOPASSWD:ALL
55   shell: /bin/bash
56   ssh_authorized_keys:
57     - ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQgQDGsnzP+1Q6NgeeKFTd/+Mom+UCYJTL/wzI
58
59 ## Update apt database and upgrade packages on first boot
60 #package_update: true
61 #package_upgrade: true
62 package_update: true
63 package_upgrade: true
64
65 ## Install additional packages on first boot
66 #packages:
67 #- pwgen
68 #- pastebinit
69 #- [libpython2.7, 2.7.3-0ubuntu3.1]
70 packages:
71 - git
72 - tree
73 - unzip
74 - iperf
75 - net-tools
76 - linux-tools-common
77 - linux-tools-raspi
78 - build-essential
79 - gdb
80 - openmpi-common
81 - openmpi-bin
82 - libblis3-serial
83 - libblis3-openmp
84 - libopenblas0-serial
85 - libopenblas0-openmp
86
87 ## Write arbitrary files to the file-system (including binaries!)
88 #write_files:

```

```

89 #- path: /etc/default/keyboard

## Appendix ? - Build OpenMPI from Source

Do all of this on node1...

```
$ ssh node1
```

We want to avoid collisions with multiple OpenMPI installations, so remove original installed version...

```
$ sudo apt remove openmpi-common
$ sudo apt remove openmpi-bin
$ sudo apt autoremove
```

OpenMPI requires the libevent-dev package...

```
$ sudo apt install libevent-dev
```

Create a build directory, and download and, and and following BLAH, BLAH build OpenMPI...

```
$ mkdir -p ~/picluster/build/openmpi
$ cd ~/picluster/build/openmpi
$ wget https://download.open-mpi.org/release/open-mpi/v4.0/openmpi-4.0.4.tar
$ gunzip openmpi-4.0.4.tar.gz
$ tar xvf openmpi-4.0.4.tar
$ rm openmpi-4.0.4.tar
$ cd openmpi-4.0.4
$ mkdir build
$ cd build
$ ../configure CFLAGS="-O3 -march=armv8-a -mtune=cortex-a72"
$ make all
$ sudo make install
$ sudo ldconfig
```

OpenMPI will installed to /usr/local

EXTRACT FROM HPL.dat

TODO: HOW TO COPY TO ALL NODES!

## Appendix ? - Arm Performance Libraries

This does not work yet! HPL will build, but raises an illegal instruction error at runtime. At the time of writing, Arm Performance Libraries release 20.2.0 require a minimum of armv8.1-a. Unfortunately, the Raspberry Pi's Cortex-A72 cores are armv8.0-a. The next release will support armv8.0-a. Appendix included for future reference.

"Arm Performance Libraries provides optimized standard core math libraries for high-performance computing applications on Arm processors. This free version of the libraries provides optimized libraries for Arm® Neoverse™ N1-based Armv8 AArch64 implementations that are compatible with various versions of GCC. You do not require a license for this version of the libraries."

Downloaded Arm Performance Libraries 20.2.0 with GCC 9.3 for Ubuntu 16.04+.

```
$ ssh node1
$ sudo apt install environment-modules
$ mkdir picluster/armpl
$ cd picluster/armpl
$ tar xvf arm-performance-libraries_20.2_Ubuntu-16.04_gcc-9.3.tar
$ rm arm-performance-libraries_20.2_Ubuntu-16.04_gcc-9.3.tar
$ sudo ./arm-performance-libraries_20.2_Ubuntu-16.04.sh
```

The default installation directory is /opt/arm...

TODO: CHANGE TO /usr/local + ldconfig

Compile HPL with armpl...

```
$ cd ~/picluster/hpl/hpl-2.3
$ cp Make.serial Make.armpl-serial
```

Edit Make.armpl-serial...

Listing 18: Make.armpl-serial extract

```
1 # -----
2 # - Linear Algebra library (BLAS or VSIP) -----
3 # -----
4 # LAinc tells the C compiler where to find the Linear Algebra
  library
5 # header files, LAlib is defined to be the name of
  the library to be
6 # used. The variable LAdir is only used for defining LAinc and LAlib.
7 #
8 LAdir          = /opt/arm/armpl_20.2_gcc-9.3
```

```
9 LAinc      =  
10 LAlib      = -L$(LAdir)/lib -larmpl -lgfortran -lamath -lm
```

Compile HPL...

```
$ make arch=armpl-serial
```
